

Processes - Part II

Amir H. Payberah
payberah@kth.se
2022

Threads

Thread

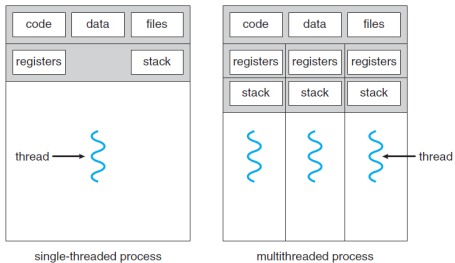

A basic unit of CPU utilization.

<https://tinyurl.com/e8scrhtne>

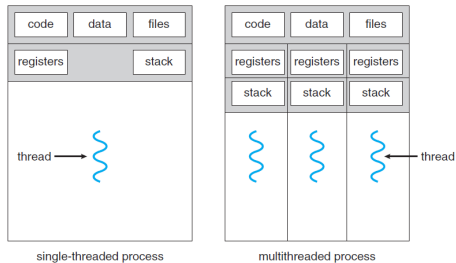

Threads (1/2)

- ▶ A traditional process: has a single **thread**.

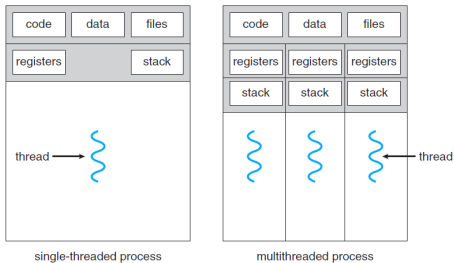

Threads (1/2)

- ▶ A traditional process: has a single **thread**.
- ▶ **Multiple threads** in a process: performing **more than one task** at a time.

Threads (1/2)

- ▶ A traditional process: has a single **thread**.
- ▶ **Multiple threads** in a process: performing **more than one task** at a time.
- ▶ Threads in a process **share code section, data section, and other OS resources**, e.g., open files.

Threads (2/2)

- ▶ Multiple tasks of an **application** can be implemented by **separate threads**.
 - Update display
 - Fetch data
 - Spell checking
 - Answer a network request

Threads - Example

- ▶ Multi-threaded web-server architecture

Threads Benefits

- ▶ **Responsiveness**: allow continued execution if part of process is blocked.

Threads Benefits

- ▶ **Responsiveness**: allow continued execution if part of process is blocked.
- ▶ **Resource Sharing**: threads share resources of process, easier than shared memory or message passing.

Threads Benefits

- ▶ **Responsiveness:** allow continued execution if part of process is blocked.
- ▶ **Resource Sharing:** threads share resources of process, easier than shared memory or message passing.
- ▶ **Economy:** thread switching has lower overhead than context switching.

Threads Benefits

- ▶ **Responsiveness:** allow continued execution if part of process is blocked.
- ▶ **Resource Sharing:** threads share resources of process, easier than shared memory or message passing.
- ▶ **Economy:** thread switching has lower overhead than context switching.
- ▶ **Scalability:** process can take advantage of multiprocessor architectures.

Multi-core Programming

Multi-core Systems

- ▶ Users need more computing performance: single-CPU → multi-CPU

Multi-core Systems

- ▶ Users need **more computing performance**: **single-CPU** → **multi-CPU**
- ▶ A similar trend in system design: **multi-core** systems
 - Each **core** appears as a **separate processor**.

Multi-core Systems

- ▶ Users need **more computing performance**: **single-CPU** → **multi-CPU**
- ▶ A similar trend in system design: **multi-core** systems
 - Each **core** appears as a **separate processor**.

- ▶ **Multi-threaded** programming
 - Improves **concurrency** and more **efficient** use of multiple cores.

Concurrency vs. Parallelism (1/2)

- ▶ **Concurrency**: supporting more than one task by allowing all the tasks to make progress.

Concurrency vs. Parallelism (1/2)

- ▶ **Concurrency**: supporting more than one task by allowing all the tasks to make progress.
 - A scheduler providing concurrency.

Concurrency vs. Parallelism (1/2)

- ▶ **Concurrency**: supporting more than one task by allowing all the tasks to make progress.
 - A scheduler providing concurrency.

- ▶ **Concurrent** execution on a single-core system.

Concurrency vs. Parallelism (2/2)

- ▶ **Parallelism**: performing more than one task simultaneously.

Concurrency vs. Parallelism (2/2)

- ▶ **Parallelism**: performing more than one task simultaneously.
- ▶ **Parallelism** on a multi-core system.

Types of Parallelism

► Data parallelism

- Distributes subsets of the **same data** across multiple cores, **same operation** on each.

Types of Parallelism

▶ Data parallelism

- Distributes subsets of the **same data** across multiple cores, **same operation** on each.

▶ Task parallelism

- Distributes **threads** across cores, each thread performing **unique operation**.

Multi-threading Models

User Threads and Kernel Threads

- ▶ **User threads:** managed by **user-level threads library**.

- ▶ **Kernel threads:** supported by the **Kernel**.

User Threads and Kernel Threads

- ▶ **User threads:** managed by **user-level threads library**.
 - Three primary **thread libraries**:
 - POSIX pthreads
 - Windows threads
 - Java threads
- ▶ **Kernel threads:** supported by the **Kernel**.

Multi-Threading Models

- ▶ Many-to-One
- ▶ One-to-One
- ▶ Many-to-Many

Many-to-One Model

- ▶ Many user-level threads mapped to single kernel thread.

Many-to-One Model

- ▶ Many user-level threads mapped to single kernel thread.
- ▶ One thread blocking causes all to block.

Many-to-One Model

- ▶ Many **user-level** threads mapped to **single kernel thread**.
- ▶ One thread **blocking** causes **all** to block.
- ▶ Multiple threads may **not run in parallel** on **multi-core** system because only one may be in kernel at a time.

Many-to-One Model

- ▶ Many **user-level** threads mapped to **single kernel thread**.
- ▶ One thread **blocking** causes **all** to block.
- ▶ Multiple threads may **not run in parallel** on **multi-core** system because only one may be in kernel at a time.
- ▶ Few systems currently use this model.
 - Solaris green threads
 - GNU portable threads

One-to-One Model

- ▶ Each user-level thread maps to one kernel thread.

One-to-One Model

- ▶ Each **user-level** thread maps to **one kernel** thread.
- ▶ Creating a **user-level** thread creates a **kernel** thread.

One-to-One Model

- ▶ Each **user-level** thread maps to **one kernel** thread.
- ▶ Creating a **user-level** thread creates a **kernel** thread.
- ▶ More **concurrency** than **many-to-one**.

One-to-One Model

- ▶ Each **user-level** thread maps to **one kernel** thread.
- ▶ Creating a **user-level** thread creates a **kernel** thread.
- ▶ More **concurrency** than **many-to-one**.
- ▶ Number of threads per process sometimes restricted due to **overhead**.

One-to-One Model

- ▶ Each **user-level** thread maps to **one kernel** thread.
- ▶ Creating a **user-level** thread creates a **kernel** thread.
- ▶ More **concurrency** than **many-to-one**.
- ▶ Number of threads per process sometimes restricted due to **overhead**.
- ▶ Examples:
 - Windows
 - Linux

Many-to-Many Model

- ▶ Allows many user-level threads to be mapped to many kernel threads.

Many-to-Many Model

- ▶ Allows **many user-level** threads to be mapped to **many kernel** threads.
- ▶ Allows the OS to create a **sufficient number** of kernel threads.

Many-to-Many Model

- ▶ Allows **many user-level** threads to be mapped to **many kernel** threads.
- ▶ Allows the OS to create a **sufficient number** of kernel threads.
- ▶ Examples:
 - Windows with the ThreadFiber package
 - Otherwise not very common

Thread Libraries

Thread Libraries (1/2)

- ▶ **Thread library** provides programmer with **API** for **creating and managing threads**.

Thread Libraries (1/2)

- ▶ **Thread library** provides programmer with **API** for **creating and managing threads**.
- ▶ **Two** primary ways of implementing:
 - Library entirely in **user-space**.
 - **Kernel-level** library supported by the OS.

Thread Libraries (2/2)

- ▶ Pthread

- Either a user-level or a kernel-level library.

Thread Libraries (2/2)

- ▶ **Pthread**
 - Either a user-level or a kernel-level library.

- ▶ **Windows thread**
 - Kernel-level library.

Thread Libraries (2/2)

- ▶ **Pthread**
 - Either a user-level or a kernel-level library.

- ▶ **Windows thread**
 - Kernel-level library.

- ▶ **Java thread**
 - Uses a thread library available on the host system.

Pthreads

- ▶ A POSIX API for thread creation and synchronization.

Pthreads

- ▶ A POSIX API for thread creation and synchronization.
- ▶ Specification, not implementation.

Pthreads

- ▶ A POSIX API for thread creation and synchronization.
- ▶ Specification, not implementation.
- ▶ API specifies behavior of the thread library, implementation is up to development of the library.

Pthreads

- ▶ A POSIX API for thread creation and synchronization.
- ▶ Specification, not implementation.
- ▶ API specifies behavior of the thread library, implementation is up to development of the library.
- ▶ Common in UNIX OSs, e.g., Solaris, Linux, Mac OS X

Thread ID

- ▶ The **thread ID (TID)** is the thread analogue to the **process ID (PID)**.

Thread ID

- ▶ The **thread ID (TID)** is the thread analogue to the **process ID (PID)**.
- ▶ The **PID** is assigned by the **Linux kernel**, and **TID** is assigned in the **Pthread library**.

Thread ID

- ▶ The **thread ID (TID)** is the thread analogue to the **process ID (PID)**.
- ▶ The **PID** is assigned by the **Linux kernel**, and **TID** is assigned in the **Pthread library**.
- ▶ Represented by **pthread_t**.

Thread ID

- ▶ The **thread ID (TID)** is the thread analogue to the **process ID (PID)**.
- ▶ The **PID** is assigned by the **Linux kernel**, and **TID** is assigned in the **Pthread library**.
- ▶ Represented by **pthread_t**.
- ▶ Obtaining a TID at runtime:

```
#include <pthread.h>  
  
pthread_t pthread_self(void);
```

Creating Threads

- ▶ `pthread_create()` defines and launches a new thread.

```
#include <pthread.h>

int pthread_create(pthread_t *thread, const pthread_attr_t *attr,
void *(*thread_func)(void *), void *arg);
```

Creating Threads

- ▶ `pthread_create()` defines and launches a new thread.

```
#include <pthread.h>

int pthread_create(pthread_t *thread, const pthread_attr_t *attr,
void *(*thread_func)(void *), void *arg);
```

- ▶ `thread_func` has the following signature:

```
void *thread_func(void *arg);
```

Terminating Threads

- ▶ Terminating yourself by calling `pthread_exit()`.

```
#include <pthread.h>  
  
void pthread_exit(void *retval);
```

Terminating Threads

- ▶ Terminating yourself by calling `pthread_exit()`.

```
#include <pthread.h>

void pthread_exit(void *retval);
```

- ▶ Terminating others by calling `pthread_cancel()`.

```
#include <pthread.h>

int pthread_cancel(pthread_t thread);
```

Joining and Detaching Threads

- ▶ **Joining** allows one thread to **block** while **waiting** for the **termination** of another.

```
#include <pthread.h>

int pthread_join(pthread_t thread, void **retval);
int pthread_detach(pthread_t thread);
```

[<https://computing.llnl.gov/tutorials/pthreads/#Joining>]

Joining and Detaching Threads

- ▶ **Joining** allows one thread to **block** while **waiting** for the **termination** of another.
- ▶ You use **join** if you care about what value the thread returns when it is done, and use **detach** if you do not.

```
#include <pthread.h>

int pthread_join(pthread_t thread, void **retval);
int pthread_detach(pthread_t thread);
```

[<https://computing.llnl.gov/tutorials/pthreads/#Joining>]

A Threading Example

```
void *thread_func(void *message) {
    printf("%s\n", (const char *)message);
    return message;
}

int main(void) {
    pthread_t thread1, thread2;
    const char *message1 = "Thread 1";
    const char *message2 = "Thread 2";

    // Create two threads, each with a different message.
    pthread_create(&thread1, NULL, thread_func, (void *)message1);
    pthread_create(&thread2, NULL, thread_func, (void *)message2);

    // Wait for the threads to exit.
    pthread_join(thread1, NULL);
    pthread_join(thread2, NULL);

    return 0;
}
```

Implicit Threading

Implicit Threading

- ▶ Increasing the **number of threads**: program correctness more **difficult** with **explicit threads**.

Implicit Threading

- ▶ Increasing the **number of threads**: program correctness more **difficult** with **explicit threads**.
- ▶ **Implicit threading**: creation and management of threads done by **compilers and run-time libraries** rather than programmers.

Implicit Threading

- ▶ Increasing the **number of threads**: program correctness more **difficult** with **explicit threads**.
- ▶ **Implicit threading**: creation and management of threads done by **compilers and run-time libraries** rather than programmers.
- ▶ **Four** methods explored:
 - Thread Pools
 - Fork-Join
 - OpenMP
 - Grand Central Dispatch

Thread Pools

- ▶ Create a number of threads in a pool where they **await work**.

Thread Pools

- ▶ Create a number of threads in a pool where they **await work**.
- ▶ Usually slightly **faster** to service a request with an existing thread than **create a new thread**.

Thread Pools

- ▶ Create a number of threads in a pool where they **await work**.
- ▶ Usually slightly **faster** to service a request with an existing thread than **create a new thread**.
- ▶ Allows the number of threads in the application(s) to be **bound** to the size of the pool.

Fork-Join (1/2)

- ▶ Multiple threads (tasks) are forked, and then joined.

Fork-Join (2/2)

```
Task(problem)
  if problem is small enough
    solve the problem directly
  else
    subtask1 = fork(new Task(subset of problem))
    subtask2 = fork(new Task(subset of problem))

    result1 = join(subtask1)
    result2 = join(subtask2)

  return combined results
```

Fork-Join (2/2)

```
Task(problem)
  if problem is small enough
    solve the problem directly
  else
    subtask1 = fork(new Task(subset of problem))
    subtask2 = fork(new Task(subset of problem))

    result1 = join(subtask1)
    result2 = join(subtask2)

  return combined results
```

OpenMP (1/2)

- ▶ Set of compiler **directives and APIs** for C, C++, FORTRAN.

OpenMP (1/2)

- ▶ Set of compiler **directives and APIs** for C, C++, FORTRAN.
- ▶ Identifies **parallel regions**: blocks of code that can run in parallel.

OpenMP (1/2)

- ▶ Set of compiler `directives and APIs` for C, C++, FORTRAN.
- ▶ Identifies `parallel regions`: blocks of code that can run in parallel.
- ▶ `#pragma omp parallel`: create as many threads as there are cores.
- ▶ `#pragma omp parallel for`: run for loop in parallel.

OpenMP (2/2)

```
#include <omp.h>
#include <stdio.h>

int main(int argc, char *argv[]) {

    /* sequential code */

    #pragma omp parallel
    {
        printf("I am a parallel region.");
    }

    /* sequential code */

    return 0;
}
```

Grand Central Dispatch

- ▶ Apple technology for **Mac OS X and iOS**: extensions to C, C++ API, and run-time library.

Grand Central Dispatch

- ▶ Apple technology for **Mac OS X and iOS**: extensions to C, C++ API, and run-time library.
- ▶ Allows identification of **parallel sections**.

Grand Central Dispatch

- ▶ Apple technology for **Mac OS X and iOS**: extensions to C, C++ API, and run-time library.
- ▶ Allows identification of **parallel sections**.
- ▶ Block is in `^{}: ^{ printf("I am a block"); }`

Grand Central Dispatch

- ▶ Apple technology for **Mac OS X and iOS**: extensions to C, C++ API, and run-time library.
- ▶ Allows identification of **parallel sections**.
- ▶ Block is in `^{}: ^{ printf("I am a block"); }`
- ▶ Blocks placed in **dispatch queue**.

Grand Central Dispatch

- ▶ Apple technology for **Mac OS X and iOS**: extensions to C, C++ API, and run-time library.
- ▶ Allows identification of **parallel sections**.
- ▶ Block is in `^{}: ^{ printf("I am a block"); }`
- ▶ Blocks placed in **dispatch queue**.

```
dispatch_queue_t queue = dispatch_get_global_queue(DISPATCH_QUEUE_PRIORITY_DEFAULT, 0);  
dispatch_async(queue, ^{ printf("I am a block."); });
```

Threading Issues

Threading Issues

- ▶ The `fork()` and `exec()` system calls

Threading Issues

- ▶ The `fork()` and `exec()` system calls
- ▶ Signal handling

Threading Issues

- ▶ The `fork()` and `exec()` system calls
- ▶ Signal handling
- ▶ Thread-Local Storage (TLS)

Threading Issues

- ▶ The `fork()` and `exec()` system calls
- ▶ Signal handling
- ▶ Thread-Local Storage (TLS)
- ▶ Thread cancellation

The `fork()` and `exec()` System Calls

- ▶ Does `fork()` duplicate only the **calling thread** or **all threads**?

The `fork()` and `exec()` System Calls

- ▶ Does `fork()` duplicate only the **calling thread** or **all threads**?
 - Some UNIXes have **two versions** of `fork`.

The `fork()` and `exec()` System Calls

- ▶ Does `fork()` duplicate only the **calling thread** or **all threads**?
 - Some UNIXes have **two versions** of `fork`.
- ▶ `exec()` usually works as **normal**: replace the **entire process**, including **all threads**.

Signal Handling (1/2)

- ▶ Signals are used in UNIX systems to **notify a process** that a **particular event** has occurred.

Signal Handling (1/2)

- ▶ Signals are used in UNIX systems to **notify a process** that a **particular event** has occurred.
- ▶ A **signal handler** is used to process signals:

Signal Handling (1/2)

- ▶ Signals are used in UNIX systems to notify a process that a particular event has occurred.
- ▶ A signal handler is used to process signals:
 1. Signal is generated by particular event.

Signal Handling (1/2)

- ▶ Signals are used in UNIX systems to notify a process that a particular event has occurred.
- ▶ A signal handler is used to process signals:
 1. Signal is generated by particular event.
 2. Signal is delivered to a process.

Signal Handling (1/2)

- ▶ Signals are used in UNIX systems to notify a process that a particular event has occurred.
- ▶ A signal handler is used to process signals:
 1. Signal is generated by particular event.
 2. Signal is delivered to a process.
 3. Signal is handled by the signal handlers, either the default or user-defined.

Signal Handling (1/2)

- ▶ Signals are used in UNIX systems to notify a process that a particular event has occurred.
- ▶ A signal handler is used to process signals:
 1. Signal is generated by particular event.
 2. Signal is delivered to a process.
 3. Signal is handled by the signal handlers, either the default or user-defined.
- ▶ Where should a signal be delivered for multi-threaded?

Signal Handling (2/2)

- ▶ Where should a signal be delivered for multi-threaded?

Signal Handling (2/2)

- ▶ Where should a signal be delivered for multi-threaded?
 - Deliver the signal to the thread to which the signal applies.

Signal Handling (2/2)

- ▶ Where should a signal be delivered for multi-threaded?
 - Deliver the signal to the thread to which the signal applies.
 - Deliver the signal to every thread in the process.

Signal Handling (2/2)

- ▶ Where should a signal be delivered for multi-threaded?
 - Deliver the signal to the thread to which the signal applies.
 - Deliver the signal to every thread in the process.
 - Deliver the signal to certain threads in the process.

Signal Handling (2/2)

- ▶ Where should a signal be delivered for multi-threaded?
 - Deliver the signal to the thread to which the signal applies.
 - Deliver the signal to every thread in the process.
 - Deliver the signal to certain threads in the process.
 - Assign a specific thread to receive all signals for the process.

Thread-Local Storage (TLS)

- ▶ TLS allows each thread to have its own copy of data.

Thread-Local Storage (TLS)

- ▶ TLS allows **each thread** to have **its own copy** of data.
- ▶ Useful when you do not **have control** over the **thread creation process** (i.e., **thread pool**)

Thread-Local Storage (TLS)

- ▶ TLS allows **each thread** to have **its own copy** of data.
- ▶ Useful when you do not **have control** over the **thread creation process** (i.e., **thread pool**)
- ▶ **Different** from **local variables**:

Thread-Local Storage (TLS)

- ▶ TLS allows **each thread** to have **its own copy** of data.
- ▶ Useful when you do not **have control** over the **thread creation process** (i.e., **thread pool**)
- ▶ Different from **local variables**:
 - **Local variables visible** only during single function invocation.

Thread-Local Storage (TLS)

- ▶ TLS allows **each thread** to have **its own copy** of data.
- ▶ Useful when you do not **have control** over the **thread creation process** (i.e., **thread pool**)
- ▶ Different from **local variables**:
 - **Local variables visible** only during single function invocation.
 - **TLS visible** across function invocations.

Thread Cancellation (1/4)

- ▶ Terminating a thread **before it has finished.**

Thread Cancellation (1/4)

- ▶ Terminating a thread **before it has finished**.
- ▶ Thread to be **canceled** is **target thread**.

Thread Cancellation (1/4)

- ▶ Terminating a thread **before it has finished**.
- ▶ Thread to be **canceled** is **target thread**.
- ▶ Two general approaches:

Thread Cancellation (1/4)

- ▶ Terminating a thread **before it has finished**.
- ▶ Thread to be **canceled** is **target thread**.
- ▶ Two general approaches:
 - **Asynchronous cancellation** terminates the **target thread immediately**.

Thread Cancellation (1/4)

- ▶ Terminating a thread **before it has finished**.
- ▶ Thread to be **canceled** is **target thread**.
- ▶ Two general approaches:
 - **Asynchronous cancellation** terminates the **target thread immediately**.
 - **Deferred cancellation** allows the **target thread** to **periodically check** if it should be cancelled.

Thread Cancellation (2/4)

```
int counter = 0;

pthread_t tmp_thread;

void* thread_func1(void* args) {
    while (1) {
        printf("thread number one\n");
        sleep(1);
        counter++;

        if (counter == 2) {
            pthread_cancel(tmp_thread);
            pthread_exit(NULL);
        }
    }
}
```

Thread Cancellation (3/4)

```
void* thread_func2(void* args) {  
    tmp_thread = pthread_self();  
  
    while (1) {  
        printf("thread number two\n");  
        sleep(1); // sleep 1 second  
    }  
}
```

Thread Cancellation (4/4)

```
int main() {  
    pthread_t thread1, thread2;  
  
    pthread_create(&thread1, NULL, thread_func1, NULL);  
    pthread_create(&thread2, NULL, thread_func2, NULL);  
  
    pthread_join(thread1, NULL);  
    pthread_join(thread2, NULL);  
}
```

Pthread Hands-On 3

```
struct thread_args {
    int a;
    double b;
};

struct thread_result {
    long x;
    double y;
};

void *thread_func(void *args_void) {
    struct thread_args *args = args_void;
    struct thread_result *res = malloc(sizeof *res);
    res->x = args->a * 2;
    res->y = args->b * 2;
    return res;
}

int main() {
    pthread_t thread;
    struct thread_args in = { .a = 10, .b = 3.14 };
    void *out_void;
    struct thread_result *out;

    <YOUR CODE>
}
```

Summary

Summary
